

Mature brains more refined

Weekend Bulletin 1 Oct 2006 - Sue Vorenberg

The brain.... gets better and more sophisticated with age, according to a University of New Mexico study. The body stops producing grey matter- the stuff the brain's thinking lobes are made of- at about age 16.

But the white matter- the connective fiber between the lobes that allows parts of the brain to interact with each other- continues to grow until about 45.
